Me

Talented and passionate software developer with real experience in building polished solutions to complex problems. Expert in almost all things javascript; well versed in application security; highly focused on performance, reliability, and quality. Looking for my next big challenge - a chance to step outside my comfort zone and improve my skills as both a developer and a leader.

Experience

Software Engineer, Azuqua — 2015 - Present

Played a major role in the rewrite of our platform and built our front end application and accompanying backend from the ground up. Use security scanning tools and manual penetration tests to help keep our users and infrastructure secure. Work closely with designers and our other engineering teams to expose new features in a user friendly way.

nodejs - express - react - redux - redis - burp suite

Developer Intern, Disney — 2014

Interned for 6 months on an internal development team. Designed and implemented a framework for interactive "widgets" that made data visualization and management easier. Worked on rebuilding the core UI of the content management system used by Disney owned companies like ESPN and ABC.

javascript - html - web sockets - d3

IT Developer, UW Biology — 2013 - 2015

Created and maintained a content management system that enabled professors to customize and create content for their course websites. Used daily by dozens of classes and thousands of students during it's lifespan.

php - symphony - sql - nodejs - angular

Education

University of Washington — Informatics, 2015

The Informatics program at UW centers around the intersection of technology and human values. While my primary focus was on building the skills to develop tools that people would love to use - I also got exposure to UI and UX side of software development that I have found invaluable.
